**totemellipso maxi**

floor mounted monolith sign  
 - assembly instructions

1. Select suitable foundation fixings sourced from your local fixings supplier to suit the floor on which the sign is to be mounted. If it is required that the foundation fixings are not visible after the sign has been assembled, drill the base plate (which has the bottom bracings already attached), to suit the fixings, within the sign structure, (inside of the routed grooves in which the panels fit).
2. Attach the base plate to lower end of ellipso extrusions with 6 off No 8 x 25.4 countersunk head self tapping screws into the location holes in the bottom of the ellipso extrusions (ensuring grooved face on the bottom plate is upwards to accept face panels).
3. Attach the top cover plate with 6 off No 8 x 25.4 countersunk head screws provided, into location holes in the top end of the ellipso extrusions.
4. Attach bottom pair of braces to ellipso extrusions and lightly clamp.
5. Attach top pair of braces to ellipso extrusions and lightly clamp.
6. Attach intermediate pair or pairs of braces at approx 1 metre intervals throughout height of sign. Locate Forex formers ensuring they are centralised on top of intermediate braces; drill through former into braces and fix with self tapping screws supplied. These formers ensure the panel curvature is maintained throughout the height of the sign.
7. After ensuring the sign assembly is set square and the ellipso profiles are parallel, tighten all bracing clamps.
8. Secure the base plate to the floor with your selected foundation fixings.
9. Remove the top cover.
10. Insert the rear panel by sliding it in from the top end and hand forming the curve as it is inserted, ensuring that the panel is located in the slots of the extrusion.
11. Insert the front panel in a similar manner ensuring both panels fit snugly into the bottom grooved cover plate.
12. Re-attach the top cover plate, ensuring that the panels are correctly located in the grooves.

Sign assembly is now complete.
